Project:

Glasgow Royal Infirmary

Customer Remit:

To provide a new copper based infrastructure system within newly refurbished wards

Summary:

Greater Glasgow and Clyde Health Board recently began a major internal and external refurbishment of the historic Glasgow Royal Infirmary a building that has been operational since 1914. The work was best decided due to the nature and size of the program to be completed in a number of smaller stages and projects. SSCL tendered successfully for a number of these projects these have ranged from single ward refurbishments to large scale floor refurbishments.

In the course of these projects SSCL have worked productively and in partnership with main contractors to ensure a positive outcome. The install was completed in Brand Rex Cat6 cable along with a number of CW1308 copper cables to enable a seamless link to an already vast communications and voice network.

Conclusion:

SSCL have already completed a number of projects within the large refurbishment program successfully and have just recently started a further two floors within the hospital.
